

# **The flora of the Sangkulirang-Mangkalihat karst, Kalimantan, Indonesia**

**13 November to 7 December 2016**

**Report for the Davis Expedition Fund**

**By Mark Hughes**

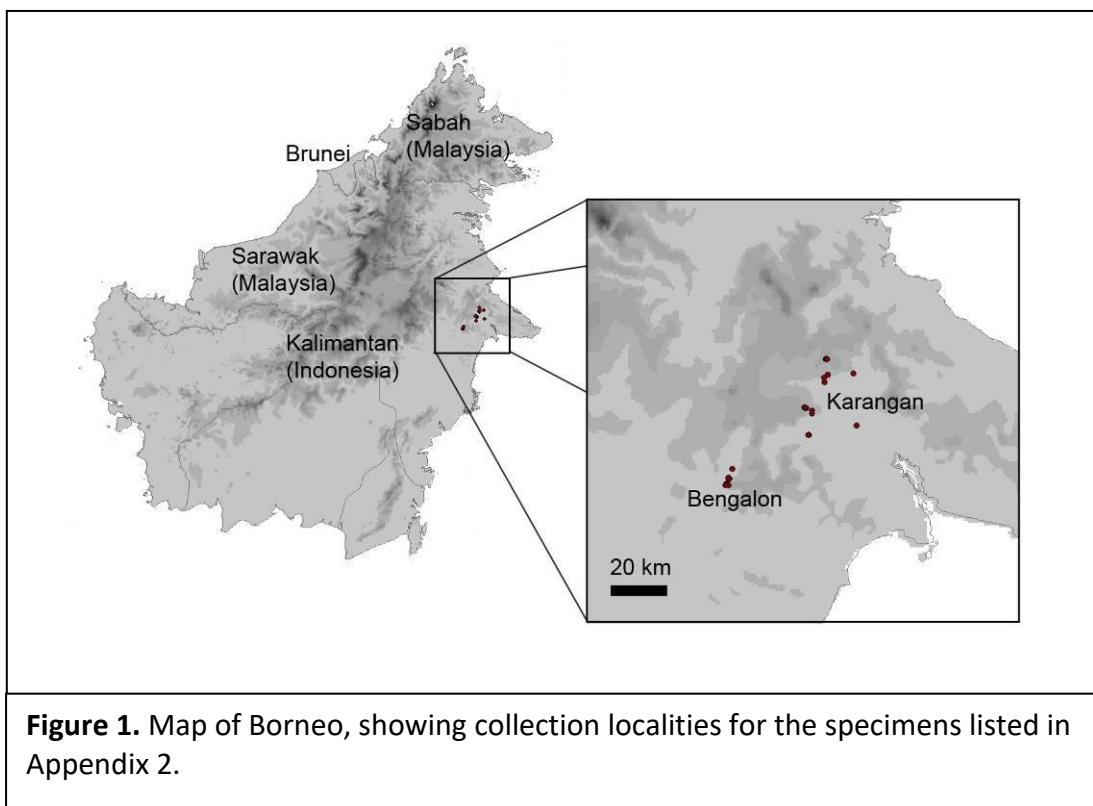

Karst landscape near Gua Tewet, Bengalon. 30 November 2016.

## Introduction

Kalimantan is one of the most botanically under-collected areas of Southeast Asia and one which is under particular threat from logging, oil palm plantation and uncontrolled burning. Scattered areas of the province harbour isolated islands of karst limestone emerging from the lowlands, such as the ones which were the focus of this expedition, the Sangkulirang-Mangkalihat region (see highlighted region in Fig. 1). Limestone karst habitats harbour highly endemic and very diverse floras, and the isolation of the Sangkulirang-Mangkalihat karst system implied its flora will be particularly remarkable, and our collections from the 2016 expedition confirmed this.

We carried out a three-week expedition to make general botanical collections in the Sangkulirang-Mangkalihat limestone, with a focus on the species rich groups Begoniaceae, Gesneriaceae, Sapotaceae and Zingiberaceae. We collected herbarium material and living material, as seeds and cuttings (listed in Appendix 2). The collections will fill a gap in knowledge of the region and of these plant groups, and we have identified 7 species new to science from our preliminary analysis of the material. The collections will be used in ongoing taxonomic and biogeographic research projects, focussing on the evolution of endemism in limestone habitats.

## Participants

- Mark Hughes, RBGE, Tropical Botanist (Begonia systematics)
- Helen Yeats, RBGE, Horticulturalist (Zingiberaceae cultivation)
- Deden Girmansyah, Herbarium Bogoriense, Tropical Botanist (Begonia systematics)
- Marlina Ardiyani, Herbarium Bogoriense, Tropical Botanist (Zingiberaceae systematics)

## Itinerary

<b>13 November</b>	MH & HY Arrive in Jakarta, drive to Bogor to be near the botanic garden and herbarium
<b>14 November</b>	Meet counterparts Deden Girmansyah and Marlina Ardiyana in the herbarium at Cibinong to finalise logistics and to double check paperwork and permits.
<b>15 November</b>	By bus to Jakarta airport, fly to Balikpapan on Borneo, find accommodation and arrange car and driver for next leg of the expedition
<b>16 November</b>	Pick up supplies (collecting pole, tarpaulin, etc.), register with local police dept, meet counterpart from University who knows the Karangan area.
<b>17-18 November</b>	Drive to Karangan via Sangatta.
<b>19-24 November</b>	Collect in the Karangan region, staying in Karangan village as a base (localities listed in Appendix 2).
<b>25-29 November</b>	Drive to Hambar Batu, arrange boats and guides, head upriver to Gua Tewet and set up camp. Collect in the Bengalon vicinity, staying in camp for 5 nights.
<b>30 November</b>	Return downriver to Batu Hambar, pick up car and driver and return to Samarinda.
<b>1 December</b>	Process export permit, drive to Balikpapan and take flight to Jakarta. Drive to Bogor.
<b>2-6 December</b>	Hand over living material to Bogor Botanic Garden, and prepare the specimens for drying in the herbarium in Cibinong. Visit the immigration office for exit papers.
<b>7 December</b>	Return flights to Edinburgh (HY) and Taipei (MH).

## Methods

Herbarium material was collected in newspaper and loosely pressed at the end of each collecting day. Each collection duplicate was labelled using the number series “EKBOE”; representing East Kalimantan Bogor and Edinburgh. Each day’s bundle of specimens was placed into a separate polythene sack, and dampened with 80% alcohol to prevent mould growth and to keep the specimens in good condition until they could be dried. Seeds and spores were placed into seed packets and kept at ambient humidity. Silica dried samples

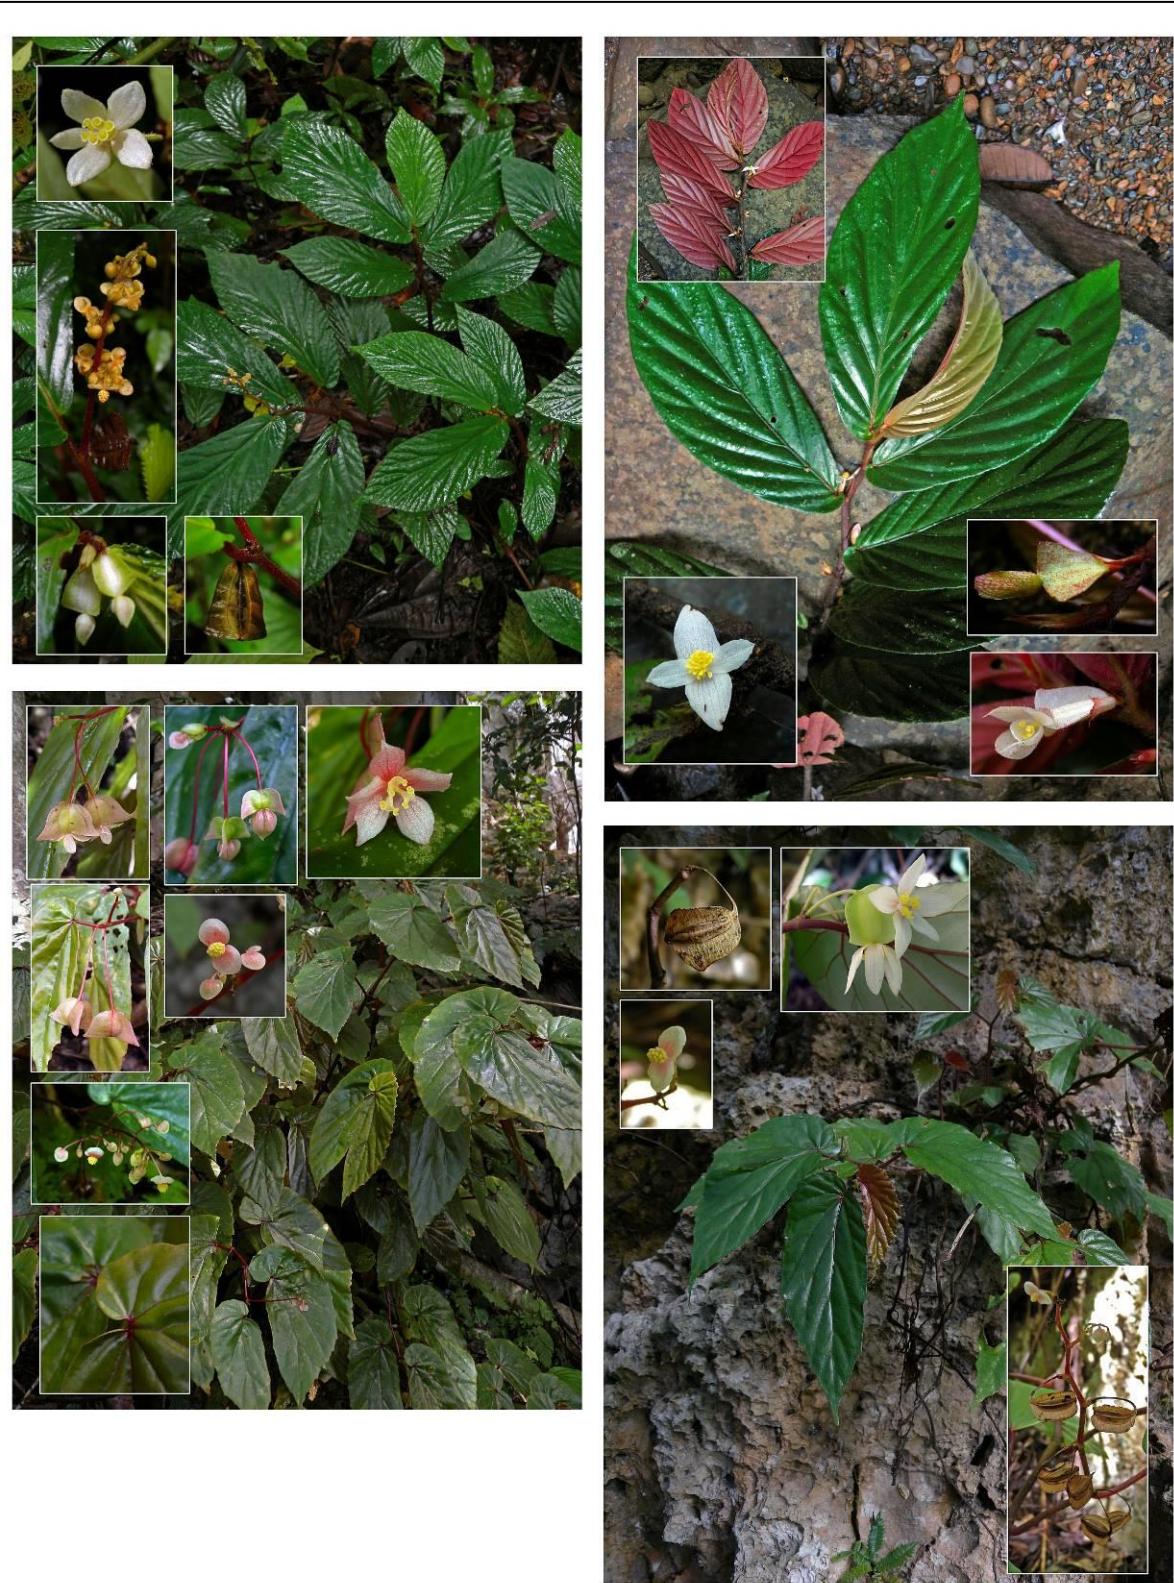

were placed in perforated paper packets and kept in a screw-topped container of silica gel crystals. Living material was trimmed as appropriate for the type of material, and wrapped in damp newspaper and stacked in a cool-box. Daily inspections were carried out to check for mould growth and water requirements.

## Outputs

- 51 living collections of *Begonia*, gingers, gesners and ferns, most new to cultivation
- 120 herbarium collections (in triplicate)
- 7 species new to science
- Reports and papers highlighting the conservation value of the karst in East Kalimantan

**Figure 2.** Two of the new species of *Begonia* were found without flowers (left; a peltate species growing on dry limestone cliffs; right, a large-leaved species growing on shale baserock near a waterfall). These are now in cultivation, and can be described when they mature and flower.

**Figure 3.** Four of the new species of *Begonia* collected, with sufficient flowering material to make type specimens and permit description.

**Figure 4.** Clockwise from top left: Collecting along the river near Gua Tewet; dissection of *Etlingera brevilabrum*; a species of *Neonauclea* characteristic of the riverside vegetation; a *Clematis* species; processing specimens in Karangan; the karst landscape of Karangan.

## **Appendix 1: Budget**

<b>Income</b>		<b>Outgoings</b>	
Sibbald Trust	£2,000	Subsistence & accom <sup>1</sup>	£2,407
Davis Fund	£3,000	Boat and skipper hire	£577
RHS	£1,000	Flights (international & regional) <sup>2</sup>	£2,227
RBGE	£3,000	Guide and counterpart fees	£1,199
Total	£9,000	Permits	£125
		Supplies & equipment <sup>3</sup>	£793
		Road transport <sup>4</sup>	£1,644
		Total	£8,972

1. 113 person-days at an average of £21:30 pppd

2. Flights Edinburgh-Singapore-Jakarta rtn x 1; Edinburgh-Singapore-Jakarta-Taipei-Edinburgh x 1; Jakarta to Balikpapan rtn x 4

3. Includes fuel, medical and courier costs

4. Includes 4WD and driver hire, plus taxi and bus fares

## Appendix 2: Collections

Num	Date	Family	Genus	Species	Subdistrict	Location
EKBOE1	19-Nov-16	Zingiberaceae	Alpinia?	sp.	Karangan	Karst forest on edge of MPI plantation
