

DAVIS EXPEDITION FUND
REPORT ON EXPEDITION / PROJECT

Expedition/Project Title: Botanical inventory of Nouabalé-Ndoki National Park

Travel Dates: 1 June - 31 August 2011

Location: Republic of Congo

Group Members: Sydney

Aims: Collecting and identifying plant specimens from
Nouabalé-Ndoki; Training local people in collecting
plants.

Outcome (not less than 300 words):-

Report on a botanical inventory of Nouabalé-Ndoki National Park, Republic of Congo

Field mission carried out from 1 June to 31 August 2011

By Sydney Ndolo Ebika
November 2011

Introduction

The forest of the Republic of Congo is part of the Congo Basin forest which is recognized worldwide for its high biodiversity in flora and fauna and as the second largest dense tropical rainforest after Amazonia (Devers, 2006). Some areas of this forest have been studied due to the importance of large mammals. Based on the ecological value documented, a complex of protected areas was established. In 2002, for example, The Sangha-Trinational landscape (STN) was created and was recognized as an important area for conservation (CARPE, 2005). The STN landscape consists of three adjacent national parks in three different countries (Lobéké, Cameroon; Dzanga-Ndoki, Central Africa Republic and Nouabalé-Ndoki, Republic of Congo). On the Republic of Congo side, the Nouabalé-Ndoki National Park was proposed by UNESCO for consideration as World Heritage due to its high biodiversity (White et Vande weghe, 2008). Past botanical surveys have assisted in documenting the importance of the flora in the park but most of these surveys indicated more collecting was necessary (Ndolo Ebika, 2010; Brueur-Ndoundou, 2009; Kami et al., 2009; Harris & Wortley, 2008; Harris, 2002; Hall et al., 2002; Moutsamboté et al., 1994).

Despite intensive surveys in the past, the botanical richness of the Congo Basin in general and the Republic of Congo in particular is poorly known. One of the main factors holding back botany in Congo is the lack of a formal Flora Guide to the plants of this country. In addition, there are few trained Congolese in botanical studies.

By collecting and identifying 214 specimens from 2006-2008 in one protected area, Nouabalé-Ndoki National Park, which was intensively studied from 1988-2002, I found 29 new records for the park (Ndolo Ebika, 2010). This result led me to continue my botanical investigations in this protected area.

The 29 new records show that more botanical studies in the Republic of Congo in general and the Nouabalé-Ndoki National Park in particular, will increase our understanding of plant diversity.

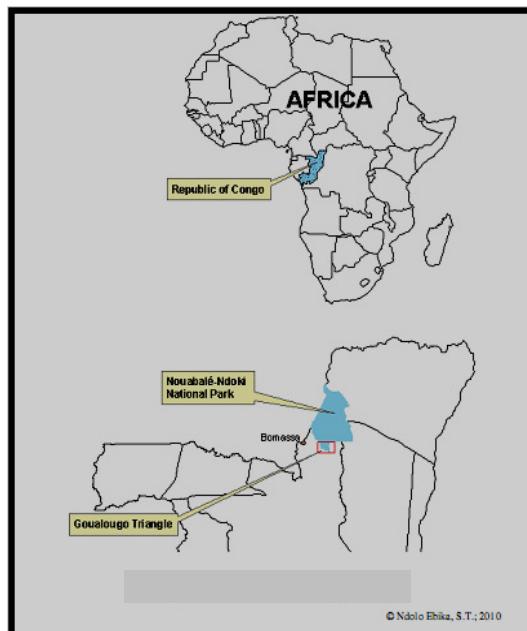

From the 1st June to the 31st September 2011 I carried out botanical inventories by means of plots sampling and general herbarium collectiong. 20 plots of 50 x 50 m each were surveyed. There were 40 families, 91 genera and 130 species accounting for 3358 individuals (3017 herbaceous plants and 341 trees). In total, 124 specimens were collected using the two methods but the vast majority of samples obtained were from outside plots.

Study area

The Nouabalé-Ndoki National Park is located in the northern Congo (see map 1) and has two adjacent national parks: Lobéké in Cameroon and Dzanga-Ndoki in Central African Republic. The three parks make the Sangha-Trinational landscape (STN); see map 2.

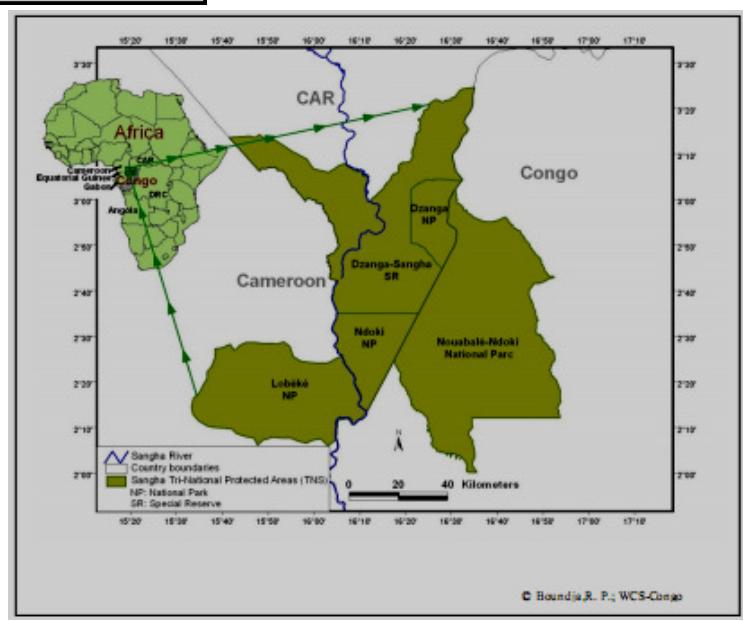

The park covers an area of 420.000 ha consisting on three main types of vegetation: mixed species forest, monodominant *Gilbertiodendron dewevrei* forest (on terra firma and seasonally flooded) and swamp forest.

For this field work, the botanical inventories were mainly done in the southern part of the Park, particularly in the Goualougo Triangle area shown on map 1.

Trinational Landscape

Equipment used

The equipment we used during this field work are shown on the below picture.

A

B

Picture1. Equipment for botanical inventory

A: 1. Hammer, 2. Secateur, 3. GPS, 4. Compass, 5. Field book, 6. Pencil, 7. Handlens, 8. Binoculars, 9. DBH meter (5 m), 10. String, 11. 50 m measuring tape

B: Press made up of: Frame, Strap, Felt, Newspaper, ventilator

Research Method

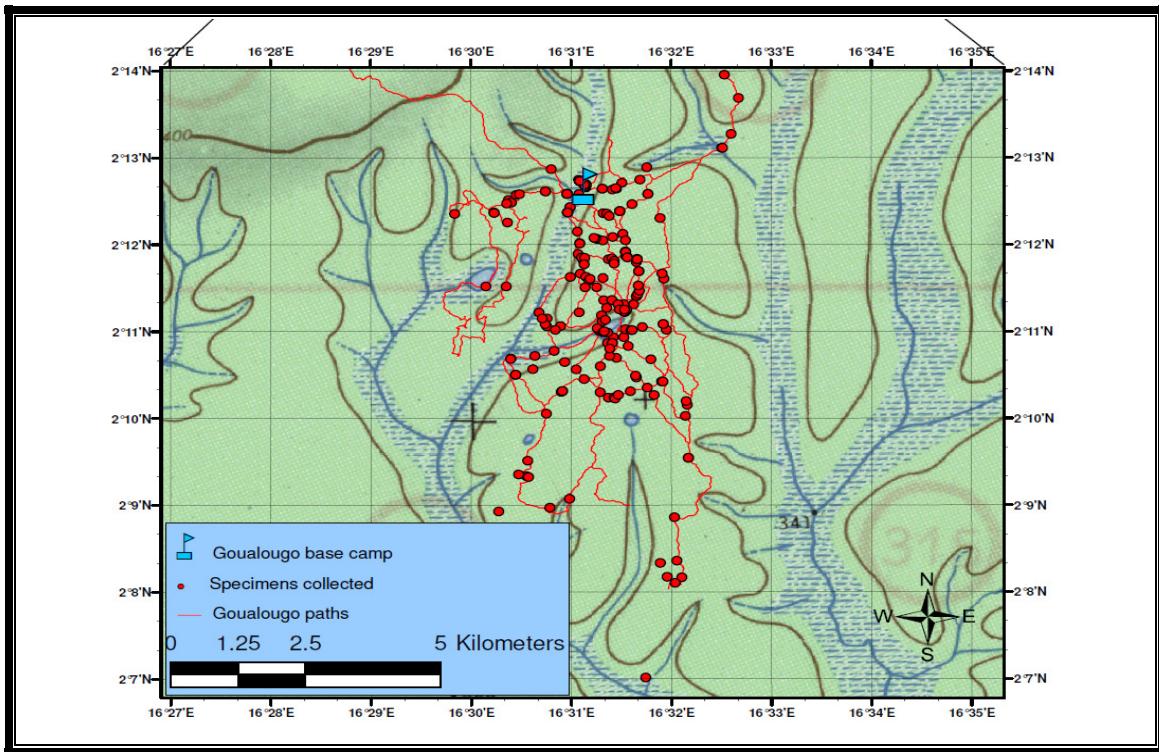

The fieldwork was carried out in the study area of the Goualougo Triangle Apes Project. The importance of accurately identifying plant species used by gorillas and chimpanzee cannot be underestimated. Without such information it is very difficult to estimate the importance of particular plant species in the apes diet or habitat preferences. For these reasons, botanical surveys were conducted in several habitat types (logged and unlogged).

Two ways of collecting plants information were used: general herbarium collections and plot sampling method.

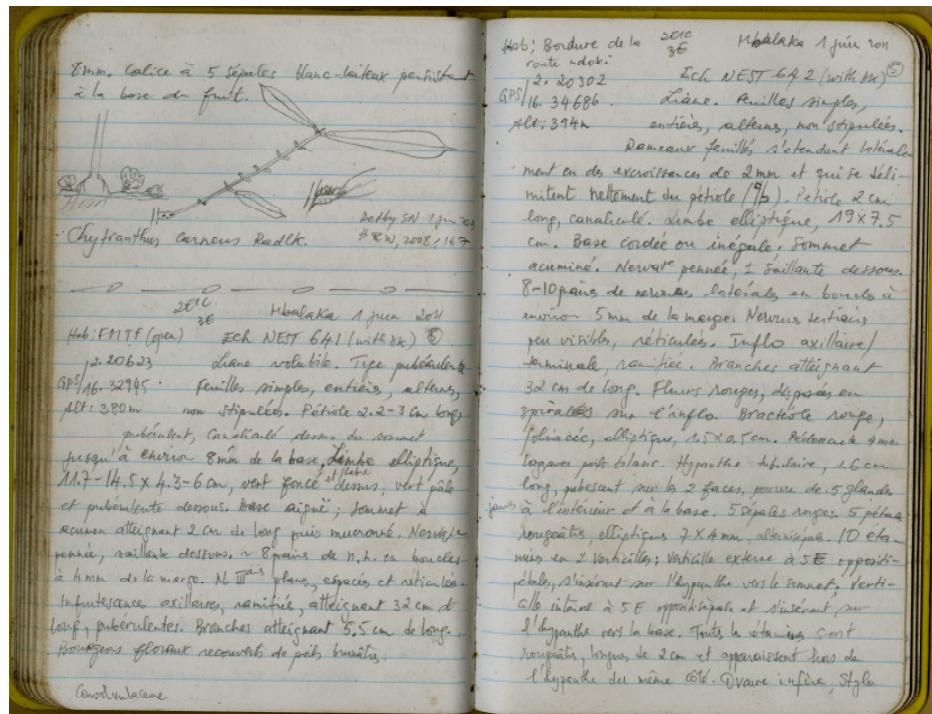

General herbarium collections

General herbarium collections are those made when walking in the forest (see map3). In some instances, particular species may be rare in the environment and collection of plants along trails outside of the botanical plots allowed us to expand our collection opportunities. For instance, the plots we did were mainly on mixed species forest and monodominant *Gilbertiodendron dewevrei* forest. In addition to those habitats covered by plots, specimens were also collected in swamp, forest alongside streams, wet places, road sides and in clearings “Yangas” in the forest.

Emphasis was placed on collecting plants either in flower or fruit production or both because this material will be especially useful during the identification process and for future taxonomic studies. Careful notes were made at the time of collecting each specimen. These field notes are: date of collection; collector’s name & collection number; GPS point (latitude and longitude); altitude (m); plant description; habitat; location (see picture 1). Specimens collected were dried on the same day. For each specimens collected, five duplicates were made and will be sent to different herbaria.

Map3. Specimens collecting for general herbarium purposes

Picture 2. Field notes

Plots sampling method

Plots were randomly placed in each habitat used by chimpanzees and gorillas.

The total size of a plot was 50×50 m. Trees with different dbh size were recorded in different subdivisions of the plot.

Step 1 (see Fig.1): From a starting point **A**, a 50 m long transect is traced and the plot is divided into two halves. This forms the line **A-B**, made by a cord. From **B**, we perpendicularly (90°) traced a 25 m line **B-C**. Then, another 50 m transect is opened from the point **C** forming **C-D** line. From **D** end, a 25 m transect will be traced to reach the starting point **A** and making the line **D-A**. Thus, a 50×25 m rectangle is traced. In this half plot, all trees of $DBH \geq 80$ cm and strangler figs of $DBH \geq 10$ cm are recorded.

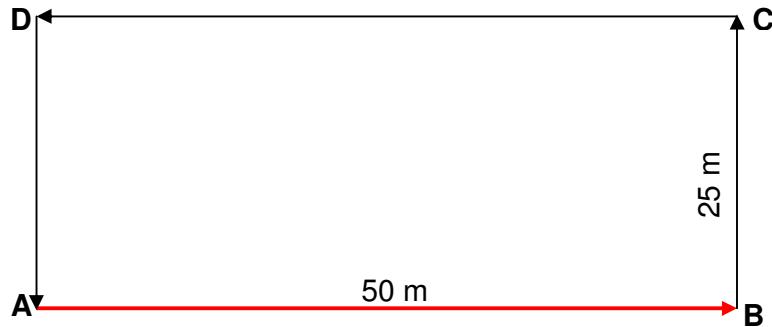

Figure 1: A 50×25 m plot

Step 2 (cf Fig.2): After recording the above data in the 50×25 m, we further subdivided the half plot into half. As result, a 50×12.5 m plot is obtained and only trees with $30 < DBH < 80$ cm are recorded.

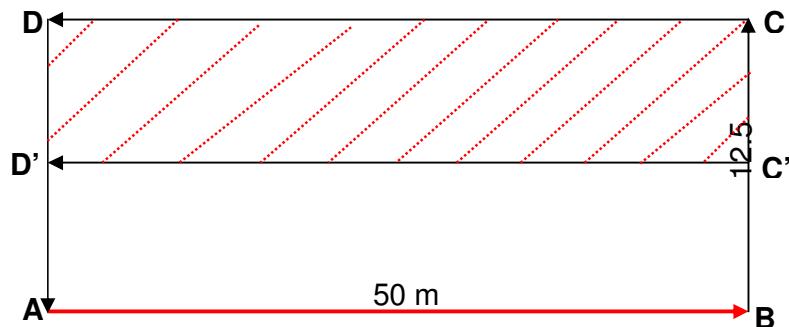

Figure 2: A 50×12.5 m plot

Step 3 (cf Fig.3): The last step in the first half plot (50 x 25 m) is to furthermore divide it to have a 50 x 2.5 m plot. Trees with $10 < \text{DBH} \leq 30$ cm are recorded and all stems of herbaceous plants belonging to the Commelinaceae, Marantaceae and Zingiberaceae are counted.

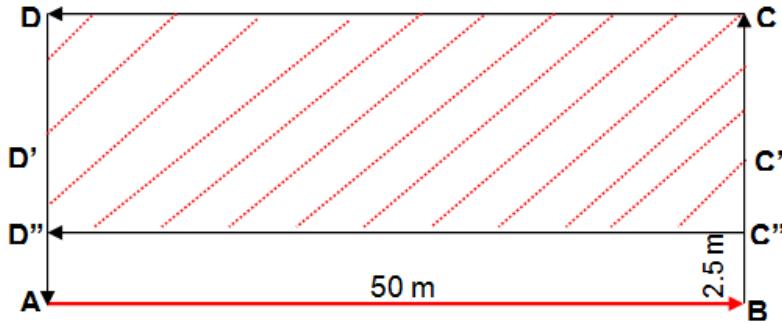

Figure 3: A 50 x 2.5 m plot

Once data recording is finished in the 50 x 2.5 m plot, we repeated the steps 1-3 for the second half (50 x 25 cm) in order to form the rectangles ABFE, ABF'E' and ABF''E''.

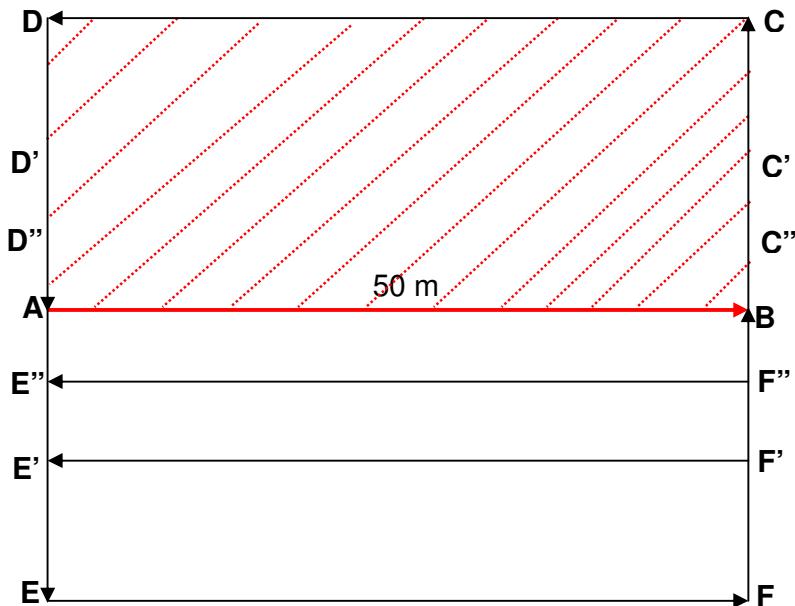

Figure 4: An overview of the entire plot 50 x 50 m.

Results

In total, 20 plots each measuring 50 x 50 m were measured during the three months. There were 40 families, 91 genera and 130 species accounting for 3358 individuals (3017 herbaceous plants and 341 trees). The table 1 shows the most speciose families (at least six species). The table 2 gives the list of species recorded in the twenty plots as well as the family and the number of individuals for each of them.

Family	Number of Species
Leguminosae	11
Sapotaceae	7
Euphorbiaceae	7
Marantaceae	7
Sapindaceae	7
Annonaceae	6
Meliaceae	6
Malvaceae	6

Table 1: The eight families with the most species

Family	Scientific name	Habit	Number of individuals
Achariaceae	<i>Caloncoba welwitschii</i>	Tree	4
Achariaceae	<i>Lindackeria dentata</i>	Tree	1
Achariaceae	<i>Scottellia klaineana</i>	Tree	4
Annonaceae	<i>Anonidium manni</i>	Tree	5
Annonaceae	<i>Cleistopholis patens</i>	Tree	2

Table 2: List of species by family and number of individuals for each species in the twenty plots.

Specimens collected

Six plant categories were used to describe 124 specimens collected. Those categories are:

- *Hemi-epiphyte*: plant growing on another (host) without depending on the host for its nutrition
- *Herb*: non-woody and erected plants
- *Liana*: woody climbers
- *Shrub*: woody and erected plant less than 10 m high
- *Tree*: woody and erected plant greater than 10 m high
- *Vine*: all non-woody climbers/ twining plants

Most specimens were collected while walking along paths rather than during plot surveys.

The number of specimens made from plots was 6 while by means of general collecting this number was 118. The number of specimens by plant category is shown on the table 3 below.

The list of specimens is provided in table 4 with the preliminary identification made at the time of collecting in the field.

Plant category	Number of specimens
Hemi-epiphyte	1
Tree	17
Vine	20
Liana	22
Herb	31
Shrub	33

Table 3: Number of specimens collected by category of plants.

Table 4: A detailed list of the 124 specimens. (Koni Davy was my assistant during the fieldwork. His work is outlined in the next section)

Species names linked to specimens in the above table are still tentative names for each specimen. Careful identification of the specimens are being done in two herbaria, Edinburgh (Royal Botanic Garden Edinburgh, UK) and herbarium Vandese (Wageningen University, Netherlands) to get accurate and confirmed names for the specimens. Images of some of the specimens listed above are shown on picture 3.

Picture 3: Photographs of six specimens collected during the fieldwork

In addition to the previous 29 new records for the Ndoki Region (Ndolo Ebika 2010), an additional 3 more species were recorded from the most recent surveys. These additional species were not only new to the Ndoki Region but were the first recordings of these species in the Republic of Congo. This shows how important it is to intensively survey the area and that the more we collect specimens in the area; the better will be our understanding of plant diversity in the Nouabalé-Ndoki National Park.

Training of local people

The work to be done in terms of collecting plants cannot be a matter of one botanist alone. It needs to be done in conjunction with others people who should be trained in basic knowledge of botany and collecting. Thus, during this field work two local people were trained. One was only trained in the use of navigation equipment (GPS and Compass) while the other, Davy Koni who was my assistant (see pictures 4 & 5), received training in both navigation and collecting. He did a great job and, for all specimens we collected together, he will be cited as co-collector.

Picture 5: Davy Koni using a compass

Acknowledgements

I am grateful to the Davis Expedition Fund which financed the 3-month field work I did in The Nouabalé-Ndoki National Park.

My grateful thanks go to my employer, The Goualougo Triangle Ape Project (GTAP), who paid for my salary during the field work.

Without the kind regards and logistical support from both, the GTAP and the park authorities, this mission would not have been possible and I am very grateful to them for their willingness to help and assist.

My work would not have been possible without the dedicated assistance of GTAP field assistance from the villages of Bomassa and Makoa.

I owe special thanks to Dr. David Harris who has continued to provide encouragement, opportunity and assistance in identifying my plant specimens. This work would not be possible without him.

I would also like to thank The National herbarium (EIC) of Congo and The Edinburgh herbarium (E) for the interest they showed in the botanical specimens from the Nouabalé-Ndoki and also for their assistance in identifying specimens.

Sydney carrying specimens at the end of the fieldwork
